

## The method is located inside the University class

1. Create a new ArrayList named uniqueStudents
2. Inside the method, create a for loop that loops for each unit in unitArrayList
3. Inside the outer loop add a for each loop that loops for every student in the unit's students ArrayList
  - If student doesn't exist in uniqueStudents → add student to uniqueStudents.
  - Else → do nothing and continue looping
4. After finishing the inner and outer loop, create a separate loop inside the method to print the description of the unique students. To do so create a for each loop that loops for each student in the uniqueStudents ArrayList and prints their details using the description method.
